

# Type 3349-1 and Type 3349-7 Pneumatic Control Valves

## Type 3349 Aseptic Angle Valve

With USP-VI diaphragm

### Application

Control valve for aseptic applications in the food and pharmaceutical industries according to DIN or ANSI standards with USP-VI diaphragm

<b>Valve sizes</b>	<b>DN 15 to 100</b>	· <b>NPS ½ to 4</b>
<b>Maximum pressure</b>	<b>10 bar</b>	· <b>150 psi</b>
<b>Temperature range</b>	<b>0 to 160 °C</b>	· <b>32 to 320 °F</b>

### Type 3349 Angle Valve with

- Type 3271 Pneumatic Actuator (Type 3349-1 Control Valve)
- Type 3277 Pneumatic Actuator (Type 3349-7 Control Valve) for integral positioner attachment

### Special features

- Valve body made of stainless steel 1.4435 or 316L
- Wetted inside surfaces with a precision-lathed or polished finish
- Categorized in conformity assessment module A of the Pressure Equipment Directive
- Wetted sealing materials comply with FDA regulations
- USP-VI 121 °C conformity

The valve body is designed without cavities and can be fitted with welding ends depending on the version. The valves are suitable for CIP (cleaning-in-place) or SIP (sterilization-in-place). The plug stem guide is sealed by a diaphragm.

A test connection enables the diaphragm to be monitored for leakages. The valve is suitable for aseptic applications.

### Principle of operation

The process medium flows through the valve in the flow-to-close direction as indicated by the arrow. The position of the valve plug (3) determines the flow rate across the cross-sectional area of flow released between plug (3) and lathed seat.

In the standard version, the plug stem is sealed by the diaphragm (6.2). In the special version, an additional backup packing (4) is used.

The test connection (4.4) allows the diaphragm to be monitored for leakage.

In the version with backup packing, the test connection is sealed by a stopper.

The test connection of valves without a backup packing is fitted with a pipe elbow to allow the drainage of any medium that escapes.

### Fail-safe position

Depending on how the springs are arranged in the pneumatic actuator (▶ T 8310-1), the valve has two different fail-safe positions effective upon air supply failure.

- **Actuator stem extends (fail-close):** The valve closes when the supply air fails.
- **Actuator stem retracts (fail-open):** The valve opens when the supply air fails.
